## YOUR PHONE KNOWS WHERE YOU ARE

With E911, your cellphone's location can be tracked within seconds. Sounds great for emergencies, but is there a dark side?

In February 2001, while driving on the state turnpike to her home in Miramar, Florida, 32-year-old Karla Gutierrez lost control of her BMW 328i and skidded into a canal. She dialed 911 on a cellphone and explained her predicament as the vehicle slowly sank. But since Gutierrez couldn't describe her precise location—"I'm not sure where I am," she told the operator—Miami-Dade County rescue units didn't know where to go to save her. By the time a passing patrolman noticed a busted fence by the accident site and found Gutierrez, she was dead.

Cases like this give emergency workers the shivers. If Gutierrez had called 911 from her home, the dispatcher would have instantly seen her exact location on a computer terminal, because landlines are matched to household addresses in emergency-services databases. But mobile phones are untethered to any network and provide no clue about where an SOS is coming from.

With more than 200,000 emergency calls coming from cellphones daily, the Federal Communications Commission is eager to remedy this defect. In 1997, the agency ordered wireless carriers to equip their systems with Enhanced 911 (E911) technologies, which would enable rescuers to pinpoint a caller's location to within a few dozen meters. But privacy advocates aren't convinced that the upgrade, due to be

# Rental-car firm exceeding the privacy limit?

By [Robert Lemos](#)

Staff Writer

June 20, 2001, 11:35 AM PT

## Car renters beware: Big Brother may be riding shotgun.

In a case that could help set the bar for the amount of privacy drivers of rental cars can expect, a Connecticut man is suing a local rental company, Acme Rent-a-Car, after it used [GPS](#) (Global Positioning System) technology to track him and then fined him \$450 for speeding three times.

The case underscores the ways that new technologies can invade people's privacy, said Richard Smith, chief technologist at the not-for-profit [Privacy Foundation](#).

"Soon our cell phones will be tracking us," he said. "GPS could be one more on the checklist here. Frankly, giving out speeding tickets is the job of the police, not of private industry."

Rental car companies have used GPS devices since the mid-1990s, installing systems to give drivers directions while they're on the road. "Fleet management" companies such as [AirtQ](#) and [Fleetrack](#) are also selling newer tracking services that help companies monitor their vehicles.

## Safari by satellite

The biggest elephant in Brighton - and the world

**Satellite tracking is commonly used to avoid traffic jams. But it is now being used to find elephants in Brighton, writes BBC News Online's technology correspondent Mark Ward**

The evidence of our effect on the land is all around us.

Roads divide landscapes, hills are shorn of their trees, tunnels are punched through mountains and cities pockmark the countryside with pavements and homes.

## THE INTERNET

## The revenge of geography

Mar 13th 2003

From The Economist print edition

**It was naive to imagine that the global reach of the internet would make geography irrelevant. Wireline and wireless technologies have bound the virtual and physical worlds closer than ever**

IN THE early days of the internet boom, there was much talk of the "death of distance". The emergence of a global digital network, it seemed, would put an end to mundane physical or geographical constraints. There was some truth in this. E-mail made it cheap and easy to stay in constant touch with people, whether they lived around the corner or on the other side of the globe. Companies could communicate with customers and employees no matter where they were. And like-minded individuals who shared a common interest could get together online from all round the world.

Actually, geography is far from dead. Although it is often helpful to think of the internet as a parallel digital universe, or an omnipresent "cloud", its users live in the real world where limitations of geography still apply. And these limitations extend online. Finding information relevant to a particular place, or the location associated with a specific piece of information, is not always easy. This has caused a surge of innovation, as new technologies have developed to link places on the internet with places in the real world—stitching together the supposedly separate virtual and physical worlds.

# The Revenge of Geography

---

- *Economist* 3/15/03
  - the virtual and physical worlds are increasingly correlated
- Physical distance important in the virtual world
- Physical location allows integration

# The locations of e-government

---

- **u**, the location of the user
  - the user interface location
  - point-like
- **s**, the location of interest
  - a region
  - often centered on **u**
- **d**, the location of data storage
- **p**, the location of processing

# Services for the user

---

- Maps, data based on s
  - define s
    - may be centered on u
  - identify a source of maps and data
    - determining d
  - invoke tools for data integration
- Processing services
  - directories, infrastructure for sharing
  - local or remote processing

# Defining $s$

---

- Equal to  $u$  plus a neighborhood
  - determining  $u$
- From a placename
  - invoking a gazetteer service
    - e.g. [www.alexandria.ucsb.edu](http://www.alexandria.ucsb.edu)

# Determining u

---

- Most computers do not know where they are
  - time zone defines a range of longitude
- Direct measurement
  - GPS
  - cellphone location measurement
  - WiFi, Bluetooth, ...
- Input by user or system builder
  - coordinates
  - placename plus gazetteer
  - geocoding
    - geocoding service

# Inference about IP

---

- IP registration record
- Mining text for addresses
- Commercial incentive
  - targeted advertising, spam
  - biased search engines
- Military/intelligence incentive
  - email to a polygon
  - sourcing intelligence

# The business of geolocation

---

- Quova: <http://www.quova.com/services/services.html>
- Digital Envoy: <http://www.digitalenvoy.net/>
- NetGeo: <http://www.caida.org/tools/utilities/netgeo/>

[contact us](#)

[demo](#)

Infosplit's objective is to offer an accurate geographic profiling solution. Our patent-pending technology consists in mapping the Internet as precisely as possible. By growing our database, we improve the accuracy of our data day after day.

Country:KR  
Metro area:SEOUL

# Options for d

---

- Where to store data in the SDI?
  - cost of dissemination goes to zero
  - close to  $s$ 
    - access to ground truth
  - level of interest determined by  $\|u-s\|$ 
    - information of geographically determined interest
    - geographic information is IGDI
    - but other information is not

# Implications for finding data

---

- Heuristics for the SAP
- Geographic information is most likely to be found on a server located within its footprint
  - convergence of  $d$  and  $s$
  - but at what level in the hierarchy?
    - jurisdiction that most closely matches the footprint
    - $\max ||J \cap F|| / (||J|| ||F||)^{1/2}$

# Transitioning map libraries

---

- From central services to unique services
  - from general collections to special collections
  - from UCSB's Map and Imagery Laboratory to the Alexandria Digital Library
- There will always be more than one service
  - no amazon.com of geographic information
    - [www.alexandria.ucsb.edu](http://www.alexandria.ucsb.edu)
    - [www.geographynetwork.com](http://www.geographynetwork.com)
    - [www.geodata.gov](http://www.geodata.gov)
- Unique services must declare themselves
  - through collection-level metadata (CLM)
  - formalizing and publishing d

# High-priority geoservices

---

- Geocoding
  - tied to data, update issue
- Gazetteer
  - conversion between general or domain-specific placename and coordinates
  - geoparsing
    - identification and decoding of placename references in text
    - mapping and associating news stories
  - queries based on placenames
    - how far is the capital of Belgium from the capital of France?
- What else, is there a general model?

# Conclusions

---

- Location is increasingly important in cyberspace
  - four locations are relevant to e-government
- New technologies are making spatially enabled e-government more and more attractive
  - standards and protocols facilitate sharing data and services
- Vertical integration, knowing where to look remain unsolved problems
  - legacies of previous technologies
  - requiring creative solutions
