•Sustainable Urbanization

•Is sprawl accelerating or slowing down?

•Megacities and City regions: 250 World Cities and 10 city-regions

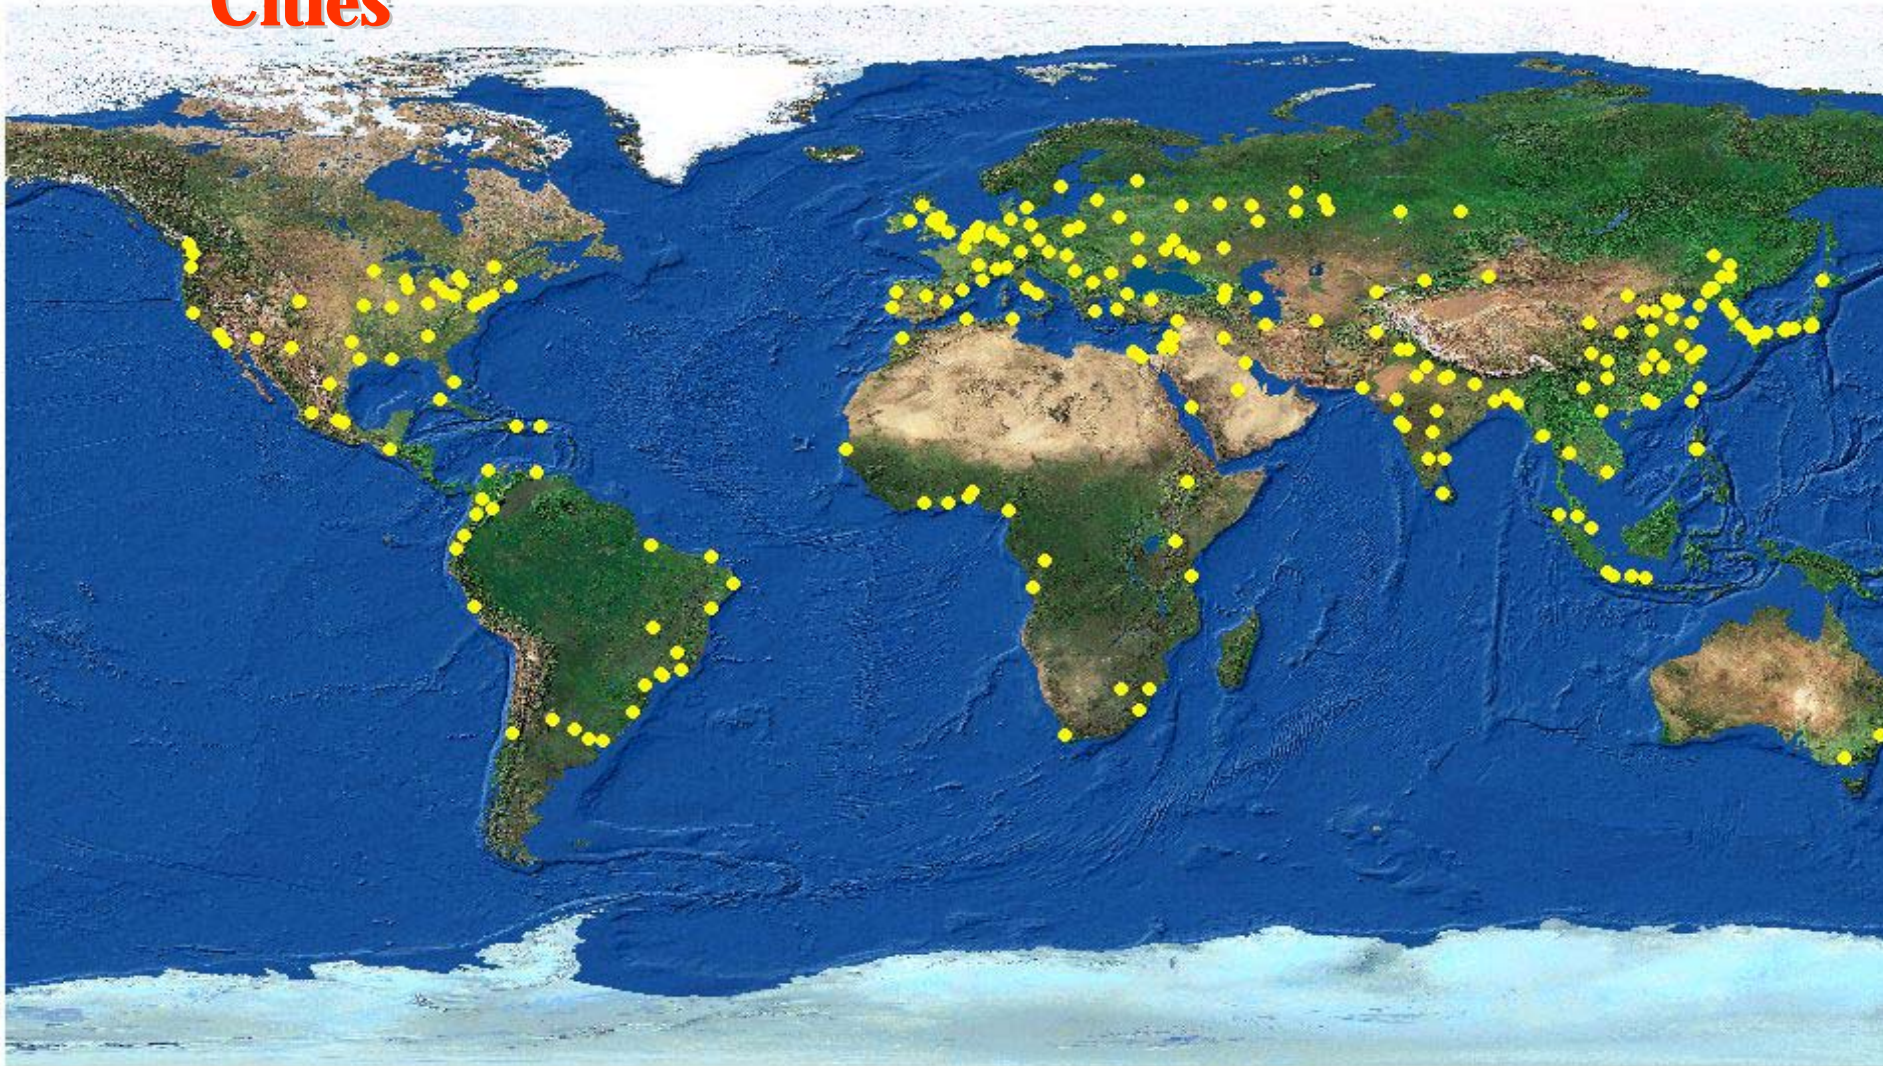

•Measuring sprawl: a methodology for measuring the rates and the nature of the areal expansion of world cities and the patterns of decreasing population density

•Ridd's VIS Model

•The Urban Gradient

Megacities and City regions: 250 World Cities

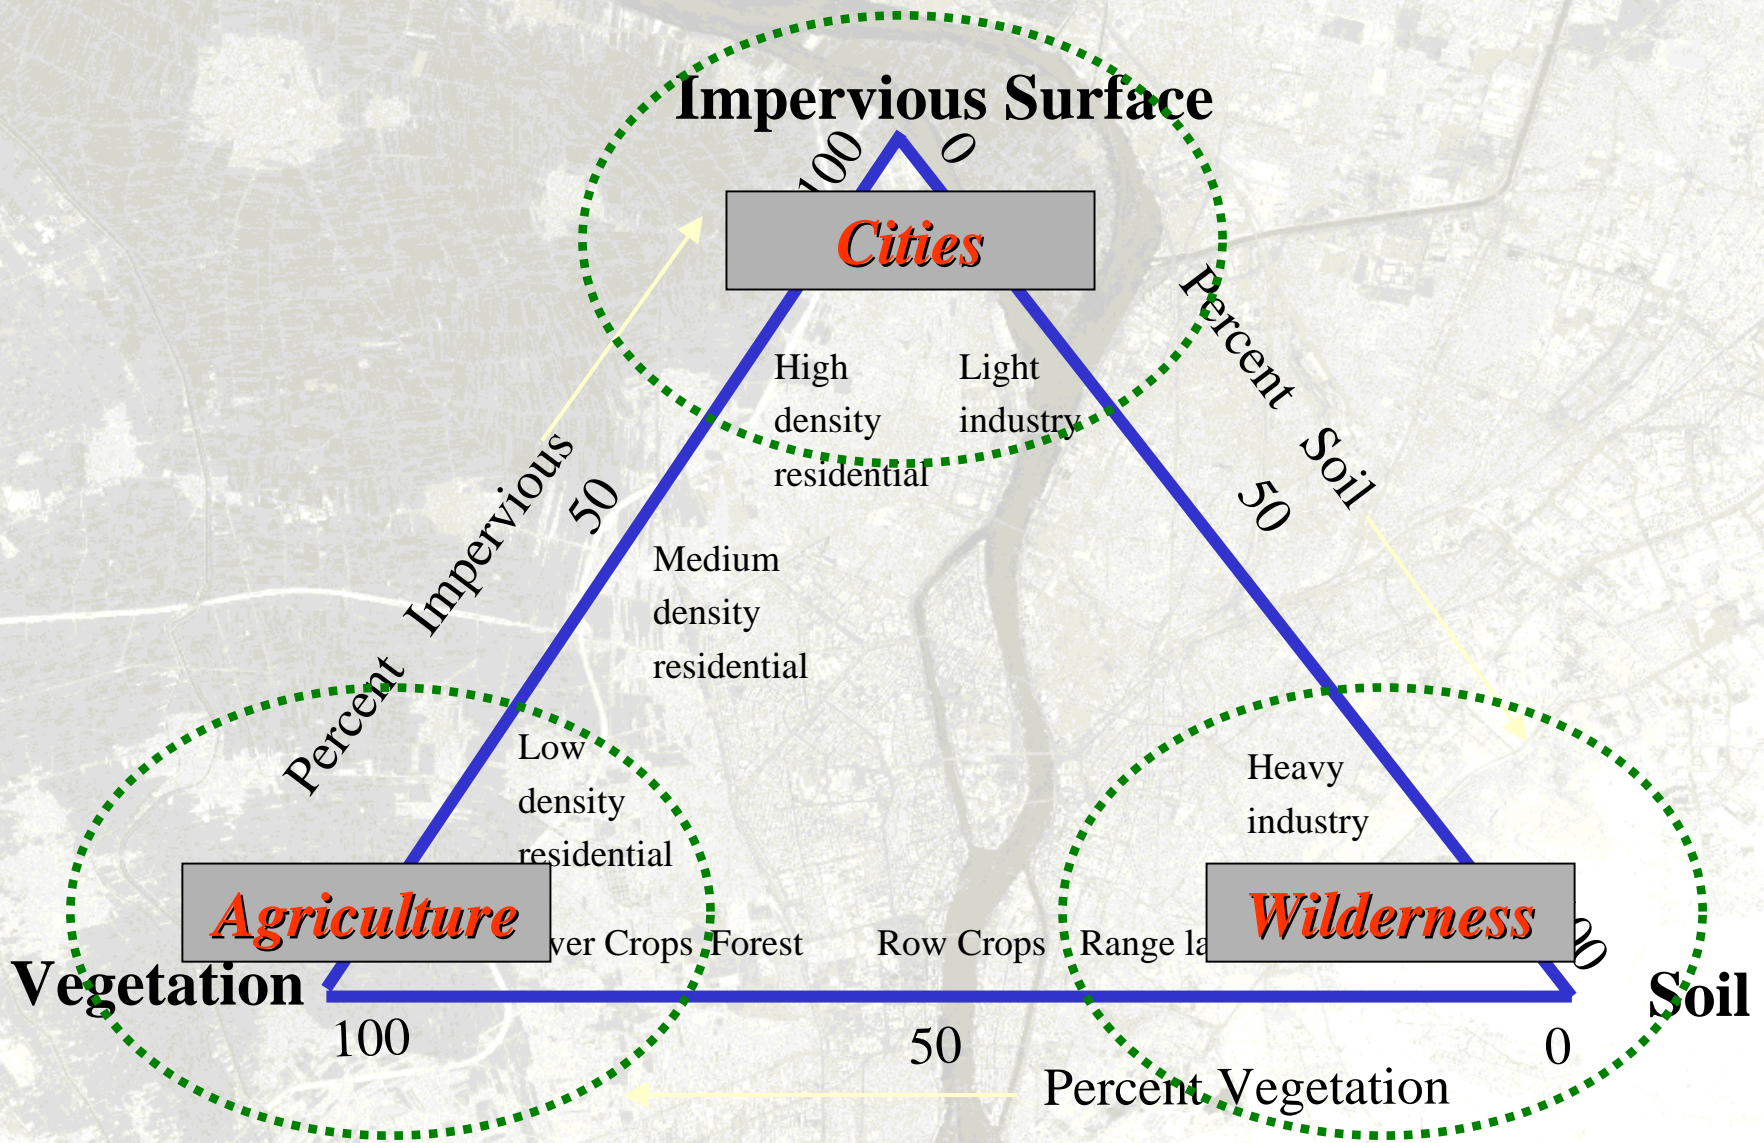

•Megacities and City regions: ten largest city-regions

• **Measuring sprawl: a methodology for measuring the rates and the nature of the areal expansion of world cities and the patterns of decreasing population density**

When we see a satellite image, such as this of Cairo, can we use it to describe what is on the ground at this point?

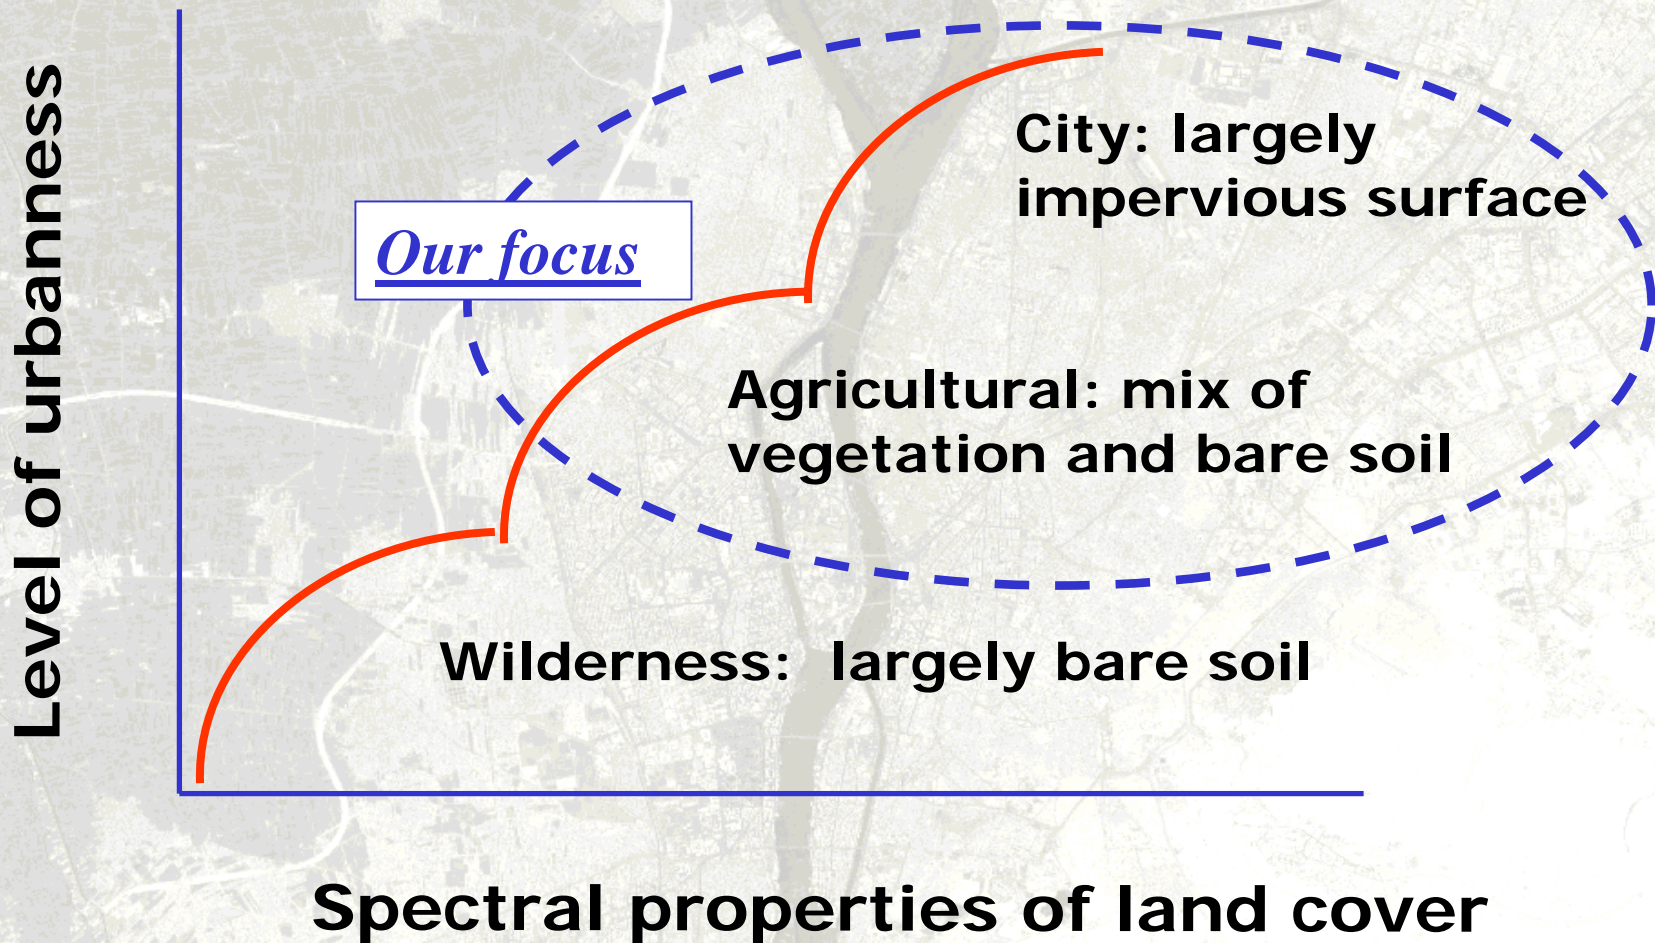

Ridd's V-I-S Model of the Urban Scene

Source: M. Ridd, 1995. "Exploring a V-I-S (Vegetation-Impervious Surface-Soil) Model or Urban Ecosystem Analysis Through Remote Sensing: Comparative Anatomy of Cities," *International Journal of Remote Sensing* 16:2165-2185

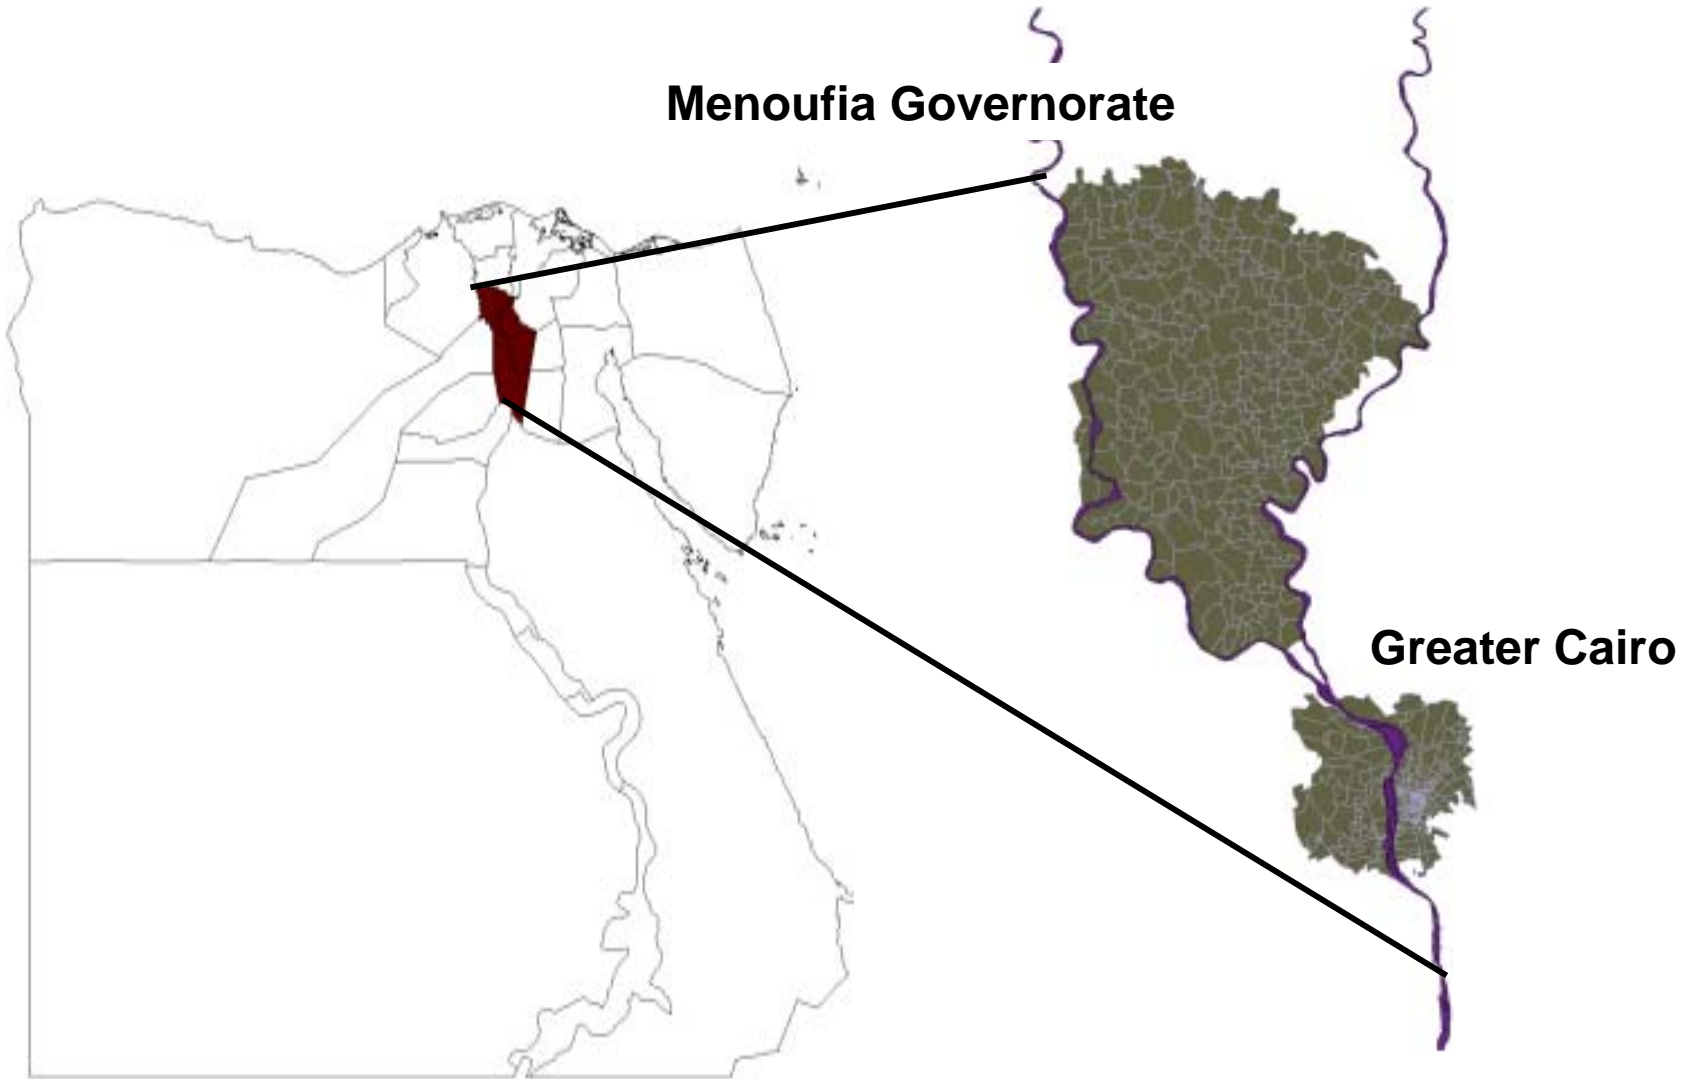

THE URBAN GRADIENT MAY BE DISCONTINUOUS

An Illustration From Egypt

Study Site

SPATIAL UNIT OF ANALYSIS:

Initially we use the administrative units from the census, so that we can compare our imagery results with the census results.

The long-term goal is to produce a gridded surface, perhaps 0.25 km, that can be compared more precisely over time.

CREATING AN URBAN GRADIENT INDEX:

We begin with the assumption that we are indexing places, not people.

Once the spatial unit of analysis is determined, then the following issues must be dealt with in the creation of an index: (1) the variables to be combined in the index; and (2) how the variables will be combined to create an index.

VARIABLES THAT ARE CANDIDATES FOR THE URBAN GRADIENT INDEX:

Imagery-Derived

Vegetation fraction

Shade/water fraction

Impervious surface fraction

Bare soil fraction

Landscape metrics—measures of spatial complexity and configuration

Census-Derived

Total population

Population per sq km

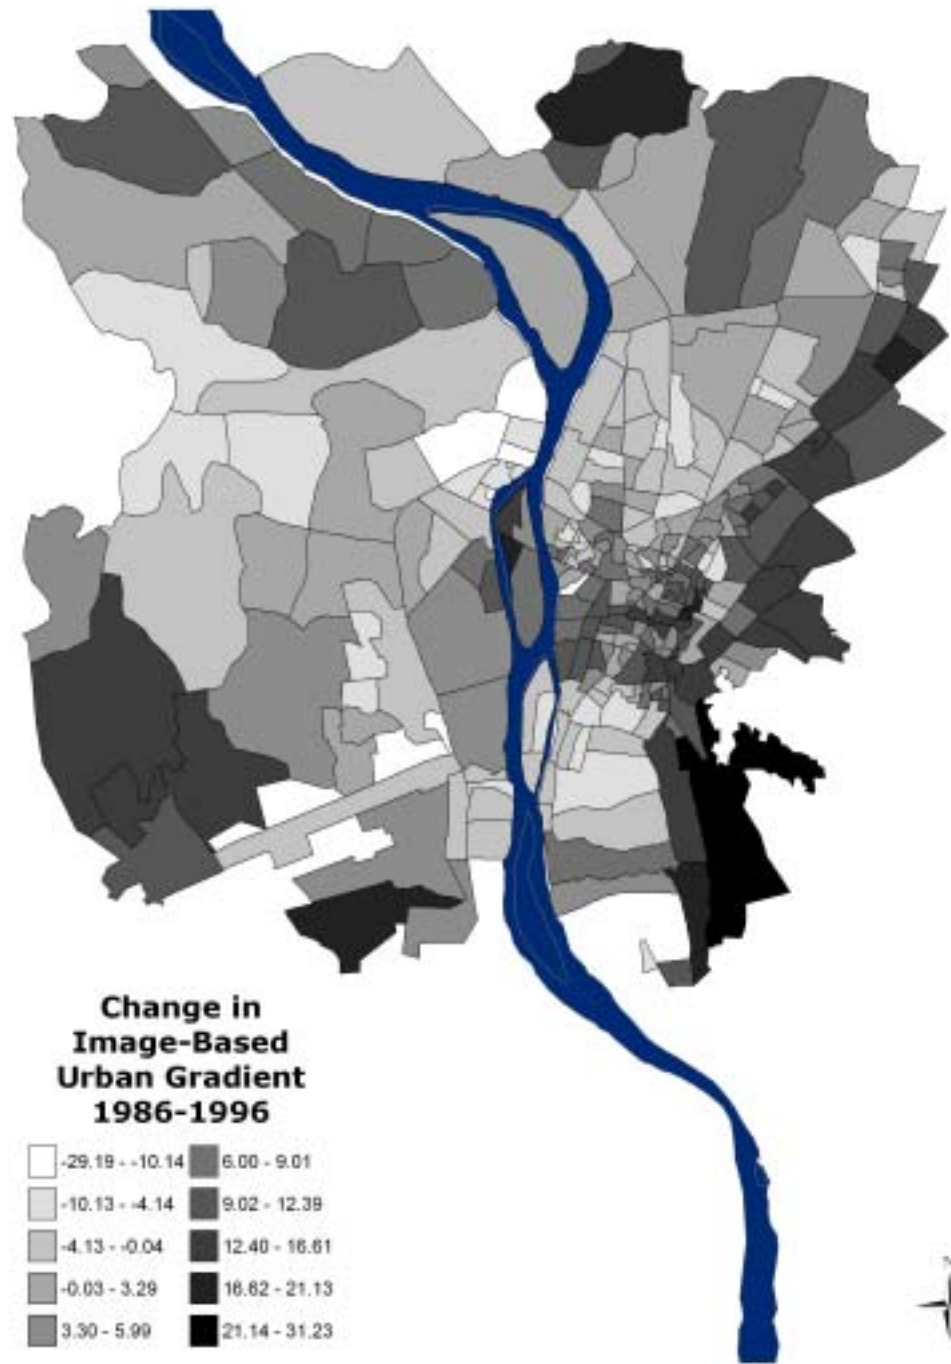

Percent of males not in agriculture

COMBINING VARIABLES INTO AN INDEX:

$$image_index = imp + (2 \times \sqrt{soil}) + (2 \times \sqrt{shade})$$

$$census_index = \left\{ \left[\ln(pop_density) \times (non_ag) \right] / 12.82 \right\} \times 10$$

Spatial Distribution of Change in Image-based Urban Gradient: 1986-1996

CONCLUSIONS:

By developing a quantitative measure that is comparable from place to place and time to time, we have the potential to compare regions on the basis of a score that reflects important elements of the built environment that will enable us to study changing rates of suburbanization and the world city size distribution.

An aerial photograph of a city, likely San Diego, showing a river (San Diego River) flowing through the urban area. A large, bright white area is visible on the right side of the image, possibly representing a large industrial or commercial site. The text is overlaid on the image.
